Description

In 2005, the health authorities of Region Västerbotten initiated the Salut Programme. The initiative got its name from the word "salutogenic" as the basic idea is to promote processes that give children and their parents an opportunity to increase control over their health and ability to improve it. Since 2009/2010 it is a countywide ongoing universal health promotion intervention in a variety of sectors for parents and children 0-18 years, starting already during pregnancy. The Programme has been implemented since 2006 onwards, prompted by alarming reports of child overweight/obesity and trends of increased dental caries, already during preschool age. The programme has been developed and implemented in close collaboration with antenatal care, child health care, dental services, open preschools and schools.

The Programme aims to support and strengthen initiated and ongoing health promotion interventions, and universal preventive interventions to improve health and lifestyle among expectant parents and children. The main focus areas are: to promote healthy eating habits, physical activity and good psychosocial health, and to prevent obesity and caries. In other words, the Programme combines both health promotion and universal prevention interventions in order to improve health and well-being, as well as to avoid ill health and disease for the whole population. To achieve the aforementioned aims, the Salut Programme includes a package of interventions using a family-centred approach. The interventions are integrated within ordinary public services. Programme development, implementation and dissemination have been carried out stepwise, with respect to geography, which facilitates evaluation efforts. The Programme has stepwise become a quite unique infrastructure to research on children, their parents and their living conditions. The Programme is followed and evaluated using registers, surveys, interviews, observations and records, and has generated 3 doctoral thesis and 20 international peer-reviewed articles.

Purpose:

One of the aims is to evaluate the short and long-term results of the Salut Programme in relation to the public health policy goals: maximizing public health and improving health equity while obtaining value for the money. Another aim is to pave the way for children's right to good and equal health by increasing the knowledge regarding preschool children's social-emotional problems.

Expectant parents, early in pregnancy (around gestational week 11), answer a questionnaire each on self-rated health, BMI, lifestyle and life condition. It was countywide implemented in mid-2010 and onwards. Recently, the Salut Programme data have been linked, on an individual level, to data from national registers with annual data when relevant. This includes: Medical Birth Register (pregnancy, delivery and immediate postpartum), National Patient Register (inpatient and specialist outpatient care and diagnoses), Register for Pharmaceutical Prescriptions (dispensed drugs) and Statistics Sweden (e.g. parents' income and education, family characteristics, place of birth and place of residence).

Data contains personal data

No

Unit of analysis

[Individual](#)

Population

The population in the Salut Programme includes all children and adolescents 0-18 years in Västerbotten county and all parents-to-be during pregnancy.

Time Method

[Cross-section](#)

[Longitudinal: Trend/Repeated cross-section](#)

Sampling procedure

The Salut Programme's specific interventions were developed in four pilot areas, selected to represent different geographic areas of the county and that characterize different population structures in Västerbotten. Quantitative studies are conducted either with a total survey of the population or the four pilot areas as the intervention area in comparison with the whole study population. In qualitative studies the sample are hand-picked to be as wide as possible with the aim to get as much variety as possible.
