Description

This survey was carried out immediately after the Korean National Assembly election on March 24 and include questions on knowledge about candidate winning in the respondent's local district and which party the candidate represented, interest in the election campaign, attitude toward the candidates, voting decision, vote in the 1987 presidential election, and opinion on most serious problems in Korea. There were also a number of questions dealing with illegalities committed during the election campaign and with the clean election campaign run by the National Election Management Bureau. Background variables include information on age, gender, education, monthly income, size of household, housing, occupation, and place of residence.

Sampling procedure

The sample for the survey was drawn on the basis of the 'multistage probability sample method'. At the first stage, the total sample size of 1200 were drawn with probability proportionate to electorate of the cities and communities. At the second stage, electoral constituencies within which 30 eligible

voters would be drawn were selected. Eleven constituencies were selected in Seoul, four in Pusan, two in Incheon, and one in Kwangju, and so on. Within each constituency drawn two polling districts were allocated at the third stage, and finally a systematic random sample of 15 individuals were drawn within each polling district with probability proportionate to electorate.

Time period(s) investigated

1992-03-26 - 1992-03-30
